PROFESSIONAL SUMMARY

Full-stack AI engineer who ships agentic systems 0→1 solo - system design, LLM orchestration, backend services, React interfaces and production deployment. Builds agents that take real actions against enterprise APIs with human-in-the-loop approval, schema-validated outputs, persistent context layers and fault-tolerant integrations; debugs failures across distributed services and explains system behaviour to engineers and business leads alike.

EDUCATION

B.E. Computer Engineering — MCT's Rajiv Gandhi Institute of Technology, Mumbai 2022 – 2026
CGPA: 8.54/10 | Startup Battle Winner (2025) | 6+ production-grade full-stack AI applications shipped solo end-to-end.

TECHNICAL SKILLS

Languages & Backend: TypeScript, JavaScript, Python, Java, SQL, Node.js, Express, Next.js, FastAPI, REST API design, OpenAPI, WebSockets, webhooks, BullMQ/Redis queues

AI & Agentic Systems: LLM orchestration (Groq, OpenAI, Anthropic, Gemini), tool/function calling, agent design & testing, prompt engineering, context management, RAG-adjacent memory, structured (Zod) outputs, human-in-the-loop guardrails

Workflow & Orchestration: Event-driven architecture, background workers, workflow automation, Camunda fundamentals

Databases & Infra: PostgreSQL, MongoDB, MySQL, Supabase, Redis (TTL caching), Docker, Kubernetes (fundamentals), GitHub Actions CI/CD, AWS, Vercel, Render, observability & request-level logging

Auth, Security & Frontend: OAuth2, JWT, refresh-token rotation, tenant isolation, rate limiting, TLS/SSL; React.js, Next.js, Tailwind CSS, Zustand, Redux, React Query, React Native

PROFESSIONAL EXPERIENCE

Full-Stack-Focused Frontend Developer Intern — Growthzi (AI no-code website builder) May 2025 – Aug 2025

- Owned the customer-facing frontend of an AI no-code website builder end-to-end, shipped into production in the company's core revenue product and used by real paying customers.
- Designed and built the full site-customisation engine (layout, sections, theming, content and media editing) - the primary way customers modify generated sites - from an ambiguous brief with no precedent to follow.
- Built the template library, contributed backend endpoints, schema decisions and deployments, and debugged integration failures across frontend, API and hosting layers, partnering with engineers and non-technical stakeholders.

PROJECTS (DESIGNED, BUILT & DEPLOYED SOLO, 0 → 1)

[MailPilot — Agentic AI Email Operations Assistant](#) | Next.js, TypeScript, Gmail API, Groq (Llama 3.3 70B), Pusher, Google Pub/Sub, Vercel Jul 2026 - Present

- Built an AI agent that operates a real application, not just chat: natural-language instructions become tool calls that compose, search, filter, open, reply to and forward live mail via the Gmail API.
- Engineered human-in-the-loop governance - the agent prepares and visibly fills every action but never sends autonomously; explicit user confirmation required and every step auditable in the UI.
- Managed agent context (open thread, sender, filters) for follow-ups like “reply to this”; integrated OAuth2 refresh-token rotation, MIME parsing and Pub/Sub webhooks over WebSockets for real-time sync.

[RocketMan AI — Adaptive Learner Memory System](#) | Next.js, TypeScript, PostgreSQL (Supabase), Groq (Qwen / Llama 4 Scout), Zod, Vercel AI SDK Jun 2026 – July 2026

- Designed a decoupled agentic architecture: the user-facing model streams instantly while a non-blocking background worker evaluates the transcript and updates a long-term memory profile - zero added latency.
- Forced Zod-validated JSON output (concept, mastery score, confidence, evidence) into an event-sourced ledger, making agent behaviour testable and every change an auditable, measurable improvement loop.

[API Forge — AI Mock-API Generation Platform](#) | React, Node.js, Express, TypeScript, MongoDB, Redis (Upstash), Gemini, Docker Apr 2026 – Jun 2026

- Turned natural language into live, executable API services via constrained schema generation served through a dynamic routing engine, unblocking frontend teams waiting on backend delivery.
- Made it resilient: circuit-breaker Redis caching with DB fallback, write-through invalidation, dual rate limiting on LLM endpoints, and middleware logging latency/status/traffic to a live analytics dashboard.
